

# CSE 130 Programming Languages

## Datatypes

### Review so far

Many kinds of expressions:

1. Simple
2. Variables
3. Functions

### Review so far

- We've seen some **base** types and values:
  - Integers, Floats, Bool, String etc.
- Some ways to **build** up types:
  - Products (tuples), records, "lists"
  - Functions
- Design Principle: **Orthogonality**
  - Don't clutter **core language** with stuff
  - Few, powerful orthogonal building techniques
  - Put "**derived**" types, values, functions in **libraries**

### Next: Building datatypes

Three key ways to build complex types/values

#### 1. "Each-of" types

Value of T contains value of T1 **and** a value of T2

#### 2. "One-of" types

Value of T contains value of T1 **or** a value of T2

#### 3. "Recursive"

Value of T contains (sub)-value of **same type** T

### Next: Building datatypes

Three key ways to build complex types/values

#### 1. "Each-of" types (**T1 \* T2**)

Value of T contains value of T1 **and** a value of T2

#### 2. "One-of" types

Value of T contains value of T1 **or** a value of T2

#### 3. "Recursive"

Value of T contains (sub)-value of **same type** T

### Suppose I wanted ...

... a program that processed lists of attributes

- Name (string)
- Age (integer)
- ...

## Suppose I wanted ...

... a program that processed lists of attributes

- Name (string)
- Age (integer)
- DOB (int-int-int)
- Address (string)
- Height (float)
- Alive (boolean)
- Phone (int-int)
- email (string)

Many kinds of attributes (too many to put in a record)

- can have multiple names, addresses, phones, emails etc.

Want to store them in a **list**. Can I?

## Constructing Datatypes

```
type t = C1 of t1 | C2 of t2 | ... | Cn of tn
```

$t$  is a new datatype.

A value of type  $t$  is either:

- a value of type  $t_1$  placed in a box labeled  $C1$
- Or a value of type  $t_2$  placed in a box labeled  $C2$
- Or ...
- Or a value of type  $t_n$  placed in a box labeled  $Cn$

## Constructing Datatypes

```
type t = C1 of t1 | C2 of t2 | ... | Cn of tn
```

All have the type  $t$

## Suppose I wanted ...

Attributes:

- Name (string)
- Age (integer)
- DOB (int-int-int)
- Address (string)
- Height (real)
- Alive (boolean)
- Phone (int-int)
- email (string)

```
type attrib =
  Name of string
| Age of int
| DOB of int*int*int
| Address of string
| Height of float
| Alive of bool
| Phone of int*int
| Email of string;;
```

## How to PUT values into box?

## How to PUT values into box?

How to create values of type `attrib`?

```
# let a1 = Name "Bob";;
val x : attrib = Name "Bob"
# let a2 = Height 5.83;;
val a2 : attrib = Height 5.83
# let year = 1977 ;;
val year : int = 1977
# let a3 = DOB (9,8,year) ;;
val a3 : attrib = DOB (9,8,1977)
# let a1 = [a1;a2;a3];;
val a3 : attrib list = ...
```

```
type attrib =
  Name of string
| Age of int
| DOB of int*int*int
| Address of string
| Height of float
| Alive of bool
| Phone of int*int
| Email of string;;
```

## Constructing Datatypes

```
type attrib
= Name of string | Age of int | DOB of int*int*int
| Address of string | Height of float | Alive of bool
| Phone of int*int | Email of string;;
```

Name "Bob"      Age 34      DOB (9, 8, 77)

All have type **attrib**

## One-of types

- We've defined a "one-of" type named `attrib`

- Elements are one of:

- string,
- int,
- int\*int\*int,
- float,
- bool ...

```
datatype attrib =
| Name of string
| Age of int
| DOB of int*int*int
| Address of string
| Height of float
| Alive of bool
| Phone of int*int
| Email of string;
```

- Can create uniform `attrib` lists

- Say I want a function to print attribs...

## How to TEST & TAKE whats in box?

Is it a ...  
string?  
or an  
int?  
or an  
int\*int\*int?  
or ...

## How to TEST & TAKE whats in box?

Look at TAG!

## How to tell whats in the box ?

```
match e with
| Name s -> printf "%s" s
| Age i -> printf "%d" i
| DOB (d,m,y) -> printf "%d/%d/%d" d m y
| Address s -> printf "%s" s
| Height h -> printf "%f" h
| Alive b -> printf "%b" b
| Phone (a,x) -> printf "(%d)-%d" a x
```

Pattern-match expression: check if `e` is of the form ...

- On match:
  - value in box bound to pattern variable
  - matching result expression is evaluated
- Simultaneously test and extract contents of box

## How to tell whats in the box ?

```
type attrib =
| Name of string
| Age of int
| DOB of int*int*int
| Address of string
| Height of float
| Alive of bool
| Phone of int*int

match e with
| Name s -> ... (*s: string *)
| Age i -> ... (*i: int *)
| DOB (d,m,y) -> ... (*d: int, m: int, y: int *)
| Address a -> ... (*a: string *)
| Height h -> ... (*h: float *)
| Alive b -> ... (*b: bool *)
| Phone (a,x) -> ... (*a: int, x: int *)
```

Pattern-match expression: check if `e` is of the form ...

- On match:
  - value in box bound to pattern variable
  - matching result expression is evaluated
- Simultaneously test and extract contents of box

## How to tell whats in the box

```
# match (Name "Bob") with
| Name s -> printf "Hello %s\n" s
| Age i  -> printf "%d years old" i
;;
Hello Bob
- : unit = ()
```

None of the cases matched the tag (Name)  
Causes nasty **Run-Time Error**

## How to TEST & TAKE whats in box?

**BEWARE!!**  
Be sure to  
handle all  
TAGS!

## Beware! Handle All TAGS!

```
# match (Name "Bob") with
| Age i  -> Printf.printf "%d" I
| Email s -> Printf.printf "%s" s
;;
Exception: Match Failure!!
```

None of the cases matched the tag (Name)  
Causes nasty **Run-Time Error**

## Compiler to the Rescue!

```
# match (Name "Bob") with
| Age i  -> Printf.printf "%d" I
| Email s -> Printf.printf "%s" s
;;
Exception: Match Failure!!
```

None of the cases matched the tag (Name)  
Causes nasty **Run-Time Error**

## Compiler To The Rescue!!

```
# let printAttrib a = match a with
| Name s -> Printf.printf "%s" s
| Age i  -> Printf.printf "%d" I
| DOB (d,m,y) -> Printf.printf "%d / %d / %d" d m y
| Address addr -> Printf.printf "%s" addr
| Height h -> Printf.printf "%f" h
| Alive b -> Printf.printf "%b" b
| Email e -> Printf.printf "%s" e
;;
Warning P: this pattern-matching is not exhaustive. Here is
an example of a value that is not matched: Phone (_, _)
```

Compile-time checks for:  
missed cases: ML warns if you miss a case!

## Compiler To The Rescue!!

```
# let printAttrib a = match a with
| Name s -> Printf.printf "%s" s
| Age i  -> Printf.printf "%d" I
| DOB (d,m,y) -> Printf.printf "%d / %d / %d" d m y
...
| Age i -> Printf.printf "%d" i ;;
Warning U: this match case is unused.
```

Compile-time checks for:  
redundant cases: ML warns if a case never matches

## Another Few Examples

```
# let printAttrib a = match a with
| Name s -> Printf.printf "%s" s
| Age i  -> Printf.printf "%d" i
| DOB (d,m,y) -> Printf.printf "%d / %d / %d" d m y
| ...
| Age i -> Printf.printf "%d" i ;;
Warning U: this match case is unused.
```

See code text file

## match-with is an Expression

```
match e with
| C1 x1 -> e1
| C2 x2 -> e2
| ...
| Cn xn -> en
```

### Type Rule

- $e_1, e_2, \dots, e_n$  must have same type  $T$
- Type of whole expression is  $T$

## match-with is an Expression

### Type Rule

- $e_1, e_2, \dots, e_n$  must have same type  $T$
- Type of whole expression is  $T$

## Benefits of match-with

<pre>match e with   C1 x1 -&gt; e1   C2 x2 -&gt; e2   ...   Cn xn -&gt; en</pre>	<pre>type t =   C1 of t1   C2 of t2   ...   Cn of tn</pre>
--	--

1. Simultaneous **test-extract-bind**
2. Compile-time checks for:
  - missed cases**: ML warns if you **miss** a  $t$  value
  - redundant cases**: ML warns if a case **never matches**

## Next: Building datatypes

Three key ways to build complex types/values

### 1. "Each-of" types $t_1 * t_2$

Value of  $T$  contains value of  $T_1$  **and** a value of  $T_2$

### 2. "One-of" types $\text{type } t = C_1 \text{ of } t_1 \mid C_2 \text{ of } t_2$

Value of  $T$  contains value of  $T_1$  **or** a value of  $T_2$

### 3. "Recursive" type

Value of  $T$  contains (sub)-value of **same type**  $T$

## "Recursive" types

```
type nat = Zero | Succ of nat
```

## “Recursive” types

```
type nat = Zero | Succ of nat
```

Wait a minute! **Zero** of what ?!

## “Recursive” types

```
type nat = Zero | Succ of nat
```

Wait a minute! **Zero** of what ?!

Relax.

Means “empty box with label **Zero**”

## “Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of **nat** ?

## “Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of **nat** ?

## “Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of **nat** ?

One **nat** contains another!

## “Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of **nat** ?

One **nat** contains another!

## “Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of `nat` ?  
One `nat` contains another!

## “Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of `nat` ?  
One `nat` contains another!  
`nat` = recursive type

## Next: Building datatypes

Three key ways to build complex types/values

1. “Each-of” types `t1 * t2`

Value of `T` contains value of `T1` and a value of `T2`

2. “One-of” types `type t = C1 of t1 | C2 of t2`

Value of `T` contains value of `T1` or a value of `T2`

3. “Recursive” type `type t = ... | C of (...*t)`

Value of `T` contains (sub)-value of same type `T`

## Next: Lets get cosy with Recursion

Recursive Code Mirrors Recursive Data

## Next: Lets get cosy with Recursion

Code Structure = Type Structure!!!

```
to_int : nat -> int
```

```
type nat =  
| Zero  
| Succ of nat
```

```
let rec to_int n =
```

to\_int : nat -> int

```
type nat =
  | Zero
  | Succ of nat
```

Base pattern (Zero)  
Inductive pattern (Succ of nat)

```
let rec to_int n =
```

to\_int : nat -> int

```
type nat =
  | Zero
  | Succ of nat
```

Base pattern (Zero)  
Inductive pattern (Succ of nat)

```
let rec to_int n = match n with
  | Zero -> 0      Base Expression
  | Succ m -> 1 + to_int m Inductive Expression
```

Base pattern (Zero)  
Inductive pattern (Succ m)

of\_int : int -> nat

```
type nat =
  | Zero
  | Succ of nat
```

```
let rec of_int n =
```

of\_int : int -> nat

```
type nat =
  | Zero
  | Succ of nat
```

Base pattern (Zero)  
Inductive pattern (Succ of nat)

```
let rec of_int n =
```

of\_int : int -> nat

```
type nat =
  | Zero
  | Succ of nat
```

Base pattern (Zero)  
Inductive pattern (Succ of nat)

```
let rec of_int n =
  if n <= 0 then
  else
```

Base pattern (if n <= 0 then)  
Inductive pattern (else)

of\_int : int -> nat

```
type nat =
  | Zero
  | Succ of nat
```

Base pattern (Zero)  
Inductive pattern (Succ of nat)

```
let rec of_int n =
  if n <= 0 then
    Zero      Base Expression
  else
    Succ (of_int (n-1)) Inductive Expression
```

Base pattern (if n <= 0 then)  
Inductive pattern (else)

plus : nat\*nat -> nat

```
type nat =
| Zero
| Succ of nat
```

```
let rec plus n m =
```

plus : nat\*nat -> nat

```
type nat =
| Zero
| Succ of nat
```

*Base pattern* (Zero)  
*Inductive pattern* (Succ)

```
let rec plus n m =
```

plus : nat\*nat -> nat

```
type nat =
| Zero
| Succ of nat
```

*Base pattern* (Zero)  
*Inductive pattern* (Succ)

```
let rec plus n m =
match m with
| Zero ->
| Succ m' ->
```

*Base pattern* (Zero)  
*Inductive pattern* (Succ)

plus : nat\*nat -> nat

```
type nat =
| Zero
| Succ of nat
```

*Base pattern* (Zero)  
*Inductive pattern* (Succ)

```
let rec plus n m =
match m with
| Zero -> n
| Succ m' -> Succ (plus n m')
```

*Base pattern* (Zero)  
*Inductive pattern* (Succ)  
*Base Expression* (n)  
*Inductive Expression* (Succ (plus n m'))

times: nat\*nat -> nat

```
type nat =
| Zero
| Succ of nat
```

```
let rec times n m =
```

times: nat\*nat -> nat

```
type nat =
| Zero
| Succ of nat
```

*Base pattern* (Zero)  
*Inductive pattern* (Succ)

```
let rec times n m =
```

times: nat\*nat -> nat

```
type nat =
  Base pattern (Zero)
  Inductive pattern (Succ of nat)
```

```
let rec times n m =
  match m with
  Base pattern (Zero) ->
  Inductive pattern (Succ m') ->
```

times: nat\*nat -> nat

```
type nat =
  Base pattern (Zero)
  Inductive pattern (Succ of nat)
```

```
let rec times n m =
  match m with
  Base pattern (Zero) -> Zero Base Expression
  Inductive pattern (Succ m') -> plus n (times n m') Inductive Expression
```

Next: Lets get cosy with Recursion

Recursive Code Mirrors Recursive Data

Lists are recursive types!

```
type int_list =
  Nil
  Cons of int * int_list
```

Think about this! What are values of int\_list ?

Cons(1,Cons(2,Cons(3,Nil))) Cons(2,Cons(3,Nil)) Cons(3,Nil) Nil

Lists aren't built-in !

```
datatype int_list =
  Nil
  Cons of int * int_list
```

Lists are a **derived** type: built using elegant core!

1. Each-of
2. One-of
3. Recursive

`::` is just a pretty way to say “Cons”  
`[]` is just a pretty way to say “Nil”

Some functions on Lists : Length

```
let rec len l =
  match l with
  Base pattern (Nil) -> 0 Base Expression
  Inductive pattern (Cons(h,t)) -> 1 + (len t) Inductive Expression
```

```
let rec len l =
  match l with
  Nil -> 0
  Cons(_,t) -> 1 + (len t)
```

No binding for head

```
let rec len l =
  match l with
  Cons(_,t) -> 1 + (len t)
  Nil -> 0
```

Pattern-matching in order

## Some functions on Lists : Append

```
let rec append (l1,l2) =
```

- Find the right **induction** strategy
  - Base case: pattern + expression
  - Induction case: pattern + expression

Well designed datatype gives strategy

## Some functions on Lists : Max

```
let rec max xs =
```

- Find the right **induction** strategy
  - Base case: pattern + expression
  - Induction case: pattern + expression

Well designed datatype gives strategy

## null, hd, tl are all functions ...

Bad ML style: More than aesthetics !

Pattern-matching better than test-extract:

- ML checks **all cases covered**
- ML checks **no redundant cases**
- ...at **compile-time**:
  - fewer errors (crashes) during execution
  - get the bugs out ASAP!

Next: Lets get cosy with Recursion

**Recursive Code Mirrors Recursive Data**

## Representing Trees

```
type tree =  
| Leaf of int  
| Node of tree*tree
```

Leaf 1

## Representing Trees

```
type tree =  
| Leaf of int  
| Node of tree*tree
```

Leaf 2

## Representing Trees

```
type tree =
| Leaf of int
| Node of tree*tree
```

Node(Leaf 1, Leaf 2)

## Representing Trees

```
type tree =
| Leaf of int
| Node of tree*tree
```

Leaf 3

## Representing Trees

```
type tree =
| Leaf of int
| Node of tree*tree
```

Node(Node(Leaf 1, Leaf 2), Leaf 3)

Next: Lets get cosy with Recursion

Recursive Code Mirrors Recursive Data

sum\_leaf: tree -> int

“Sum up the leaf values”. E.g.

```
# let t0 = Node(Node(Leaf 1, Leaf 2), Leaf 3);;
- : int = 6
```

sum\_leaf: tree -> int

```
type tree =
| Leaf of int
| Node of tree*tree
```

```
let rec sum_leaf t =
```

sum\_leaf: tree -> int

```
type tree =
  | Leaf of int
  | Node of tree*tree
```

Base pattern (Leaf)  
Inductive pattern (Node)

```
let rec sum_leaf t =
```

sum\_leaf: tree -> int

```
type tree =
  | Leaf of int
  | Node of tree*tree
```

Base pattern (Leaf)  
Inductive pattern (Node)

```
let rec sum_leaf t =
  match t with
  | Leaf n ->
  | Node (t1,t2) ->
```

Base pattern (Leaf)  
Inductive pattern (Node)

sum\_leaf: tree -> int

```
type tree =
  | Leaf of int
  | Node of tree*tree
```

Base pattern (Leaf)  
Inductive pattern (Node)

```
let rec sum_leaf t =
  match t with
  | Leaf n -> n Base Expression
  | Node (t1,t2) -> sum leaf t1 + sum leaf t2 Inductive Expression
```

Base pattern (Leaf)  
Inductive pattern (Node)

Recursive Code Mirrors Recursive Data

Code almost writes itself!

## Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- 4.0 + 2.9
- 3.78 - 5.92
- (4.0 + 2.9) \* (3.78 - 5.92)

## Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- 4.0 + 2.9 =====> 6.9
- 3.78 - 5.92 =====> -2.14
- (4.0 + 2.9) \* (3.78 - 5.92) =====> -14.766

Whats a ML **TYPE** for **REPRESENTING** expressions ?

## Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- $4.0 + 2.9 \implies 6.9$
- $3.78 - 5.92 \implies -2.14$
- $(4.0 + 2.9) * (3.78 - 5.92) \implies -14.766$

Whats a ML **TYPE** for **REPRESENTING** expressions ?

```
type expr =
| Num of float
| Add of expr*expr
| Sub of expr*expr
| Mul of expr*expr
```

## Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- $4.0 + 2.9 \implies 6.9$
- $3.78 - 5.92 \implies -2.14$
- $(4.0 + 2.9) * (3.78 - 5.92) \implies -14.766$

Whats a ML **FUNCTION** for **EVALUATING** expressions ?

```
type expr =
| Num of float
| Add of expr*expr
| Sub of expr*expr
| Mul of expr*expr
```

## Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- $4.0 + 2.9 \implies 6.9$
- $3.78 - 5.92 \implies -2.14$
- $(4.0 + 2.9) * (3.78 - 5.92) \implies -14.766$

Whats a ML **FUNCTION** for **EVALUATING** expressions ?

```
type expr =
| Num of float
| Add of expr*expr
| Sub of expr*expr
| Mul of expr*expr

let rec eval e = match e with
| Num f      -> f
| Add(e1,e2) -> eval e1 +. eval e2
| Sub(e1,e2) -> eval e1 -. eval e2
| Mul(e1,e2) -> eval e1 *. eval e2
```

## Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- $4.0 + 2.9 \implies 6.9$
- $3.78 - 5.92 \implies -2.14$
- $(4.0 + 2.9) * (3.78 - 5.92) \implies -14.766$

Whats a ML **FUNCTION** for **EVALUATING** expressions ?

```
type expr =
| Num of float
| Add of expr*expr
| Sub of expr*expr
| Mul of expr*expr

let rec eval e = match e with
| Num f      -> f
| Add(e1,e2) -> eval e1 +. eval e2
| Sub(e1,e2) -> eval e1 -. eval e2
| Mul(e1,e2) -> eval e1 *. eval e2
```
